

## **AntiFrame action 1.0**

The AntiFrame action stops other sites from displaying your page in their frameset. The page will be displayed but not in their frameset.

### **“Manual”:**

1. Place a head action object in the head section of your page.
2. Select the “onParse” event to trigger the action
3. Click the action button and select the AntiFrame action.

(For more detailed info on how to use actions in GoLive please see your online manual)

### **Troubleshooting:**

If you are using the action on a Mac and the action is grayed out or not visible please do this to fix the problem.

1. Open the action file in GL, just like any other file.
2. Save the file using “save as” and the original filename.
3. Restart GoLive.

Actions made on PCs lacks the file creator info which some Mac systems need. By using the simple procedure described above that vital information will be added.
