

The IE5.5SliceBugFix action.

Sliced images often display with a thin white line across the image in Internet Explorer 5.5. This line goes away if you reload the page or resize the window.

The IE5.5SliceBugFix action resizes the window by first shrinking it 1 pixel and then restoring it to the original size. That makes the line disappear.

Instruction:

1. Use the IE5.5SliceBugFix as a head action (in the head section of your page).
2. Set it to run "OnLoad"
